

## About MVISION Cloud for Office 365

In addition to solutions for individual Office 365 services, you can enable MVISION Cloud to work with the entire O365 suite.

With MVISION Cloud for O365, you can:

- Enforce data loss prevention policies for data at rest and in motion. MVISION Cloud offers both DLP policy management for data on the move, and On-Demand Scanning to scan data stored at rest.
- Detect activity that can identify insider threats and compromised accounts.
- Audit collaboration activity and enforce data sharing policies.
- Identify Shadow IT cloud services in use.
- Capture a complete audit trail of all user and admin activities. Centralized policy violation management pages help you keep a handle on automatic and manual remediation actions.
- Control access to data based on user role, device, and location. RBAC-based access levels make it easy to assign appropriate permissions to users.
- Encryption to protect your data. MVISION Cloud allows you to encrypt unstructured data, while continuing to enable user searches without compromising security.

## Integration Methods

Each service inside O365 (Exchange Online, SharePoint, Skype for Business, and Yammer) can be integrated using the reverse proxy or the API method. DLP policy options can vary depending on the integration method you choose.
